To whom this may concern,

**REFERENCE LETTER**

With safety being one of our highest priorities we very thoroughly researched the market for latest technologies in fire prevention, detection and suppression systems. Our management team decided to adopt a new, more efficient and productive thought process in safety and productivity measures. The mindset of management has changed from being reactive to being more proactive in fire prevention.

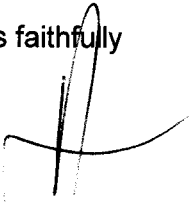

We decided to invest in a LIOS DTS fire prevention system on our conveyor infrastructure. We found the LIOS De.Tect distributed temperature measurement system robust, reliable and fit for purpose in continually measuring the temperature throughout our conveyor infrastructure as to provide the earliest warning of frictional heating.

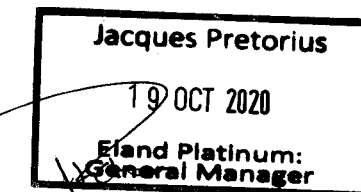

We also decided to standardize on Dafo Forrex for our mine vehicles. This product has also proven to be extremely reliable in a very harsh environment.

We highly recommend these solutions to any prospective clients who share our philosophy of prevention rather than cure.

We also highly recommend Precision Fire Projects who successfully installed and are currently still maintaining and supporting these systems.

Yours faithfully
